BA-2SB (ACI MODEL #) SUPER-PRO COLLAPSIBLE GOAL

RIM

The rim is made of 5/8" round cold rolled material and formed to an exact 18" inside diameter. One piece 3/16" flat brace, which will withstand pressures of more than 600 lb. without sustaining a permanent bend.

COLLAPSE MECHANISM

This goal is designed to absorb and decelerate the force created when a player hangs from the rim, at the same time providing a true rebound similar to that of a fixed goal. This goal incorporates a ball bearing positive latch mechanism, which holds the rim in the playing position until a preset weight or pressure is applied to the rim, at which point the rim pivots downward. When that pressure is released, two return springs snap the rim back into playing position (one spring system is not considered equal). This positive latch mechanism is self-centering for years of trouble free use.

MOUNTING PATTERN

Goal shall feature a keyhole mounting system for easy and precise installation. Goal shall have a mounting pattern of 5" x 4" and 5" x 4-1/2".

FINISH

Goal is finished in electrostatic powder coated orange.
